1. Introduction to the Case Study

With the rapid growth of the gig economy, online platforms have become an important medium for connecting workers with short-term job opportunities. A gig worker marketplace allows individuals to offer services such as repairs, cleaning, tutoring, or delivery while enabling customers to quickly find and hire workers based on their needs.

This case study focuses on designing and developing a **fully responsive multi-page website for a gig worker marketplace** using **HTML, CSS, and JavaScript**. The platform enables users to browse available services, view worker profiles, check availability, and book hourly service slots.

The project demonstrates how front-end web technologies can be combined to create a structured, interactive, and visually appealing website. It highlights the importance of responsive design, structured user interfaces, and dynamic JavaScript functionality in building modern web applications.

2. Problem Statement / Case Background (Abstract)

Background

In many communities, people require quick access to reliable workers for short-term tasks. However, traditional methods of finding workers through advertisements or word-of-mouth are inefficient and time-consuming. A digital platform that lists workers and allows easy booking can simplify this process.

Modern websites must also be **responsive and user-friendly**, ensuring they work well on both desktop and mobile devices. By integrating dynamic features such as booking systems, filtering options, and interactive UI elements, such platforms can greatly improve accessibility and efficiency.

Abstract

This case study presents the design and implementation of a **Gig Worker Marketplace Website** consisting of multiple interconnected pages. The website allows users to browse service categories, view worker profiles, check availability, and book service slots.

The system is built using **HTML for structure, CSS for styling and responsiveness, and JavaScript for interactive functionality**. The interface includes service cards, booking forms, location filters, and dynamic price calculations.

Features such as **responsive layouts, animations, booking slot logic, and filtering by location** help create a practical and user-friendly platform for connecting customers with gig workers.

3. Case Study Design

The website is designed as a **five-page responsive web application** where each page performs a specific function.

Website Structure

1. Home Page (index.html)

The home page introduces the platform and displays key information including:

- Hero section
- Featured services
- Quick service search
- Call-to-action buttons for booking workers

This page provides users with an overview of available services and guides them to other sections of the website.

2. Services Page (services.html)

The services page displays a **grid of service categories** along with worker profiles.

Features include:

- Worker profile cards
- Hourly rates
- Availability tags

- Location filtering

Users can explore different services and select workers based on their requirements.

3. Booking Page (booking.html)

This page enables users to **book service slots**.

Features include:

- Date and time slot selection
- Optional add-on services
- Booking confirmation
- Total cost calculation

JavaScript is used to dynamically calculate the booking cost.

4. Workers Page (workers.html)

The workers page shows **detailed worker profiles** including:

- Work experience
- Ratings
- Hourly rates
- Reviews from previous customers

This page helps users make informed decisions when selecting a worker.

5. Contact Page (contact.html)

The contact page provides:

- Inquiry form
- Support contact details
- Social media links

This page allows users to communicate with the platform for support or inquiries.

4. Methods & Technologies Applied in the Case Study

1. HTML (Structure)

HTML is used to create the basic structure of the website using semantic elements such as:

- header
- nav
- section
- article
- footer

Forms are used to collect booking information and user inquiries.

Example elements used:

- Dropdown menus
- Radio buttons
- Date and time inputs
- Number inputs for booking hours

2. CSS (Styling and Layout)

CSS is used to design the website layout and improve visual appearance.

Key CSS techniques include:

- **Flexbox** for navigation and service cards
- **CSS Grid** for category layouts and booking slots
- Responsive design for mobile devices
- Professional color palette

UI enhancements include:

- Hover effects on cards and buttons
- Smooth scrolling
- Card transformation effects
- Fade-in animations
- Input focus highlight effects

3. JavaScript (Functionality)

JavaScript adds interactive functionality to the website.

Key features implemented include:

- Booking slot logic
- Real-time availability updates
- Filtering workers by location
- Total booking cost calculation

JavaScript functions use:

- `querySelector()` and `getElementById()`
- `addEventListener()`
- Conditional statements
- DOM manipulation

Additional features include mobile menu toggle and smooth page scrolling.

Technology Stack Used

Programming Languages:

- HTML
- CSS
- JavaScript

Development Environment:

- Visual Studio Code

Platform:

- Web browser

5. Problem Statement / Case Study Implementation Details and Snapshots

The implementation of the Gig Worker Marketplace website is organized into multiple files.

Main Files

1. **index.html**
 - Homepage layout and hero section.
2. **services.html**
 - Service category grid and worker cards.
3. **booking.html**
 - Booking form and slot selection.
4. **workers.html**
 - Detailed worker profiles.
5. **contact.html**
 - Contact form and support information.
6. **style.css**
 - Website styling and responsive layout.
7. **script.js**
 - JavaScript logic for filtering, booking slots, and calculations.

SIMPLE PROCESS

How SkillHire Works

Book a skilled worker in four easy steps — takes less than 2 minutes.

01

Browse Services

Find the category that matches your job — electrician, plumber, cleaner, and more.

02

Pick a Worker

View profiles, ratings, experience, and hourly rates to find the right fit.

03

Book a Slot

Choose your preferred date, time slot, and number of hours needed.

04

Job Done ✓

Worker arrives on time, completes the job, and you leave a review.

WHY SKILLHIRE

Built for Trust & Speed

Every worker is verified. Every booking is transparent.

Ready to Get Work Done?

Book a skilled professional in minutes, no hassle, no waiting.

Book a Worker Now

SkillHire

Connecting people with trusted local gig workers since 2024.

6. Problem Statement / Case Study Results and Conclusion

Findings

The developed website successfully demonstrates the functionality of a gig worker marketplace.

Key outcomes include:

- Easy browsing of service categories
- Worker profile display with availability information
- Dynamic booking slot system
- Total cost calculation for bookings
- Responsive layout across devices

The use of HTML, CSS, and JavaScript enables the creation of an interactive and user-friendly web platform.

Conclusion

This case study demonstrates how a **multi-page responsive website** can be developed to simulate a gig worker marketplace. By integrating structured HTML design, responsive CSS layouts, and JavaScript interactivity, the project provides a complete front-end solution for managing service bookings.

The system can be further expanded by integrating backend technologies, databases, and authentication systems to create a fully functional marketplace platform.
